

SCAN90CP02

1.5 Gbps 2x2 LVDS Crosspoint Switch with Pre-Emphasis and IEEE 1149.6

General Description

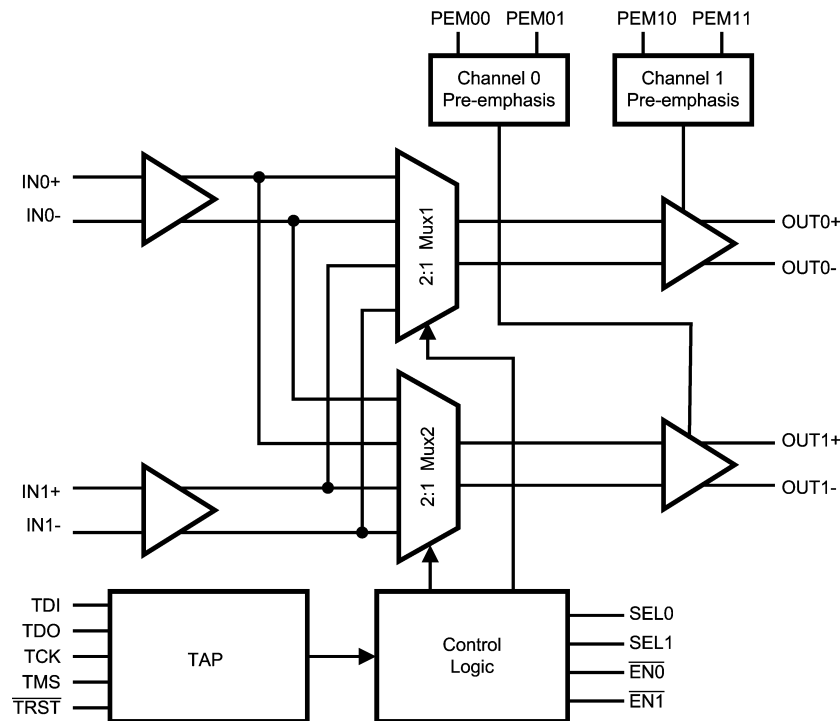

The SCAN90CP02 is a 1.5 Gbps 2 x 2 LVDS crosspoint switch. High speed data paths and flow-through pinout minimize internal device jitter, while configurable 0/25/50/100% pre-emphasis overcomes external ISI jitter effects of lossy backplanes and cables. The differential inputs interface to LVDS and Bus LVDS signals such as those on National's 10-, 16-, and 18-bit Bus LVDS SerDes, as well as CML and LVPECL. The SCAN90CP02 can also be used with ASICs and FPGAs. The non-blocking crosspoint architecture is pin-configurable as a 1:2 clock or data splitter, 2:1 redundancy mux, crossover function, or dual buffer for signal booster and stub hider applications.

Integrated IEEE 1149.1 (JTAG) and 1149.6 circuitry supports testability of both single-ended LVTTTL/CMOS and differential LVDS PCB interconnect. The 3.3V supply, CMOS process, and LVDS I/O ensure high performance at low power over the entire industrial -40 to +85°C temperature range.

Features

- 1.5 Gbps per channel
- Low power: 70 mA in dual repeater mode @1.5 Gbps
- Low output jitter
- Configurable 0/25/50/100% pre-emphasis drives lossy backplanes and cables
- Non-blocking architecture allows 1:2 splitter, 2:1 mux, crossover, and dual buffer configurations
- Flow-through pinout
- LVDS/BLVDS/CML/LVPECL inputs, LVDS Outputs
- IEEE 1149.1 and 1149.6 compliant
- Single 3.3V supply
- Separate control of inputs and outputs allows for power savings
- Industrial -40 to +85°C temperature range
- 28-lead LLP package, or 32-lead LQFP package

POWER				
V _{DD}	11, 14, 16, 22, 25	12, 16, 18, 25, 29	I, Power	V _{DD} = 3.3V ±0.3V. At least 4 low ESR 0.01 μF bypass capacitors should be connected from V _{DD} to GND plane.
GND	(Note 1)	5, 11, 15, 20, 26, 30		Ground reference to LVDS and CMOS circuitry. For the LLP package, the DAP is used as the primary GND connection to the device. The DAP is the exposed metal contact at the bottom of the LLP-28 package. It should be connected to the ground plane with at least 4 vias for optimal AC and thermal performance.

Note 1: Note that for the LLP package GND is not an actual pin on the package, the GND is connected thru the DAP on the back side of the LLP package.

Note 2: The LVDS outputs do not support a multidrop (BLVDS) environment. The LVDS output characteristics of the SCAN90CP02 device have been optimized for point-to-point backplane and cable applications.

Pre-emphasis

The pre-emphasis is used to compensate for long or lossy transmission media. Separate pins are provided for each output to minimize power consumption. Pre-emphasis is programmable to be off or to preset values per the Pre-emphasis Control Selection Table.

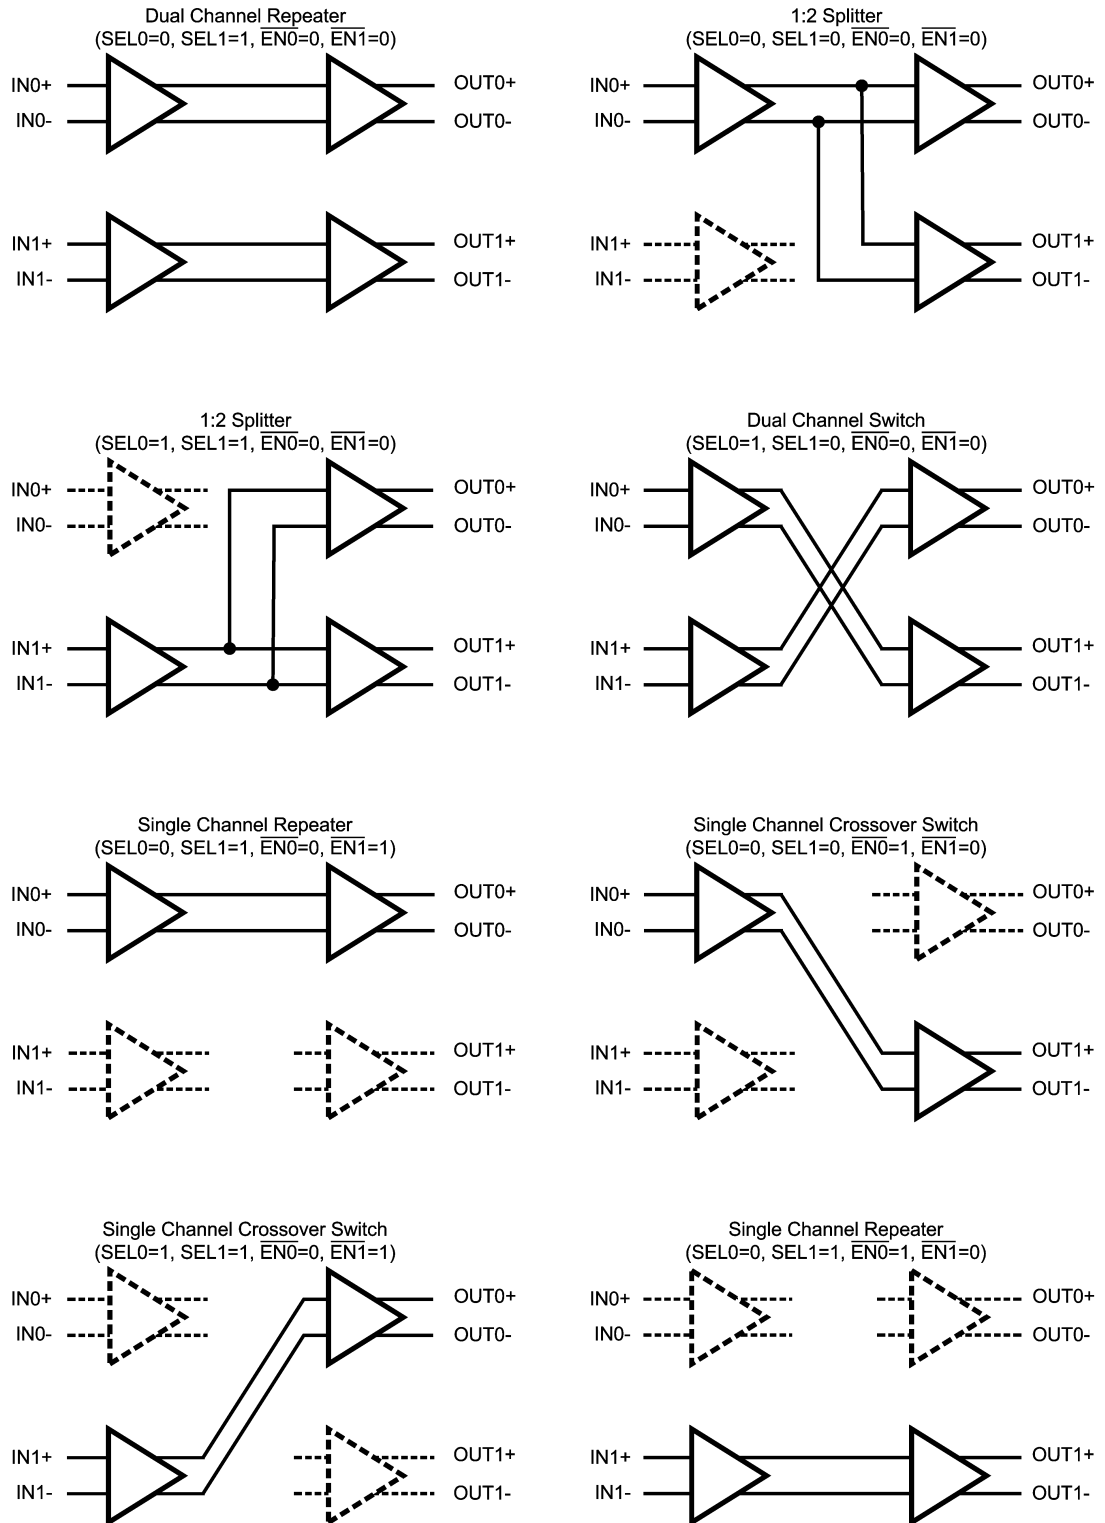

Output Characteristics

The output characteristics of the SCAN90CP02 device have been optimized for point-to-point backplane and cable applications.

Note 3: "Absolute Maximum Ratings" are the ratings beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits.

Note 4: Typical parameters are measured at $V_{DD} = 3.3V$, $T_A = 25^\circ C$. They are for reference purposes, and are not production-tested.

Note 5: Differential output voltage V_{OD} is defined as $ABS(OUT+ - OUT-)$. Differential input voltage V_{ID} is defined as $ABS(IN+ - IN-)$.

Note 6: Output offset voltage V_{OS} is defined as the average of the LVDS single-ended output voltages at logic high and logic low states.

Note 7: Jitter is the jitter from any input to any one differential LVDS output running at the specified data rate and data pattern, the other channel is powered off. Jitter is not production tested, but guaranteed through characterization on a sample basis. Random Jitter is measured RMS with a histogram including 1500 histogram window hits. K28.5 pattern is repeating bit streams of (0011111010 1100000101). This deterministic jitter or DJ pattern is measured to a histogram mean with a sample size of 350 hits. Total Jitter is measured peak to peak with a histogram including 3500 window hits.

Design-For-Test (DfT) Features

IEEE 1149.1 SUPPORT

The SCAN90CP02 supports a fully compliant IEEE 1149.1 interface. The Test Access Port (TAP) provides access to boundary scan cells at each LVTTTL I/O on the device for interconnect testing. The TAP also provides access to the IEEE 1149.6 test features if AC-coupled interconnects are used.

Refer to the BSDL file located on National's website for the details of the SCAN90CP02 IEEE 1149.1 implementation.

IEEE 1149.6 SUPPORT

AC-coupled differential interconnections on very high speed (1+ Gbps) data paths are not testable using traditional IEEE 1149.1 techniques. The IEEE 1149.1 structures and methods are intended to test static (DC-coupled), single ended networks. It is unable to test dynamic (AC-coupled) digital networks because the AC-coupling blocks static signals.

The SCAN90CP02 - which is intended for use in up to 1.5 Gbps data paths - has been designed with IEEE 1149.6 support to enable test of AC-coupled interconnects.

FAULT INSERTION

StuckAt is a feature that enables the user to override logic values on any of the external pins during normal operation. StuckAt can be thought of as having the same capabilities as the IEEE-1149.1 EXTEST instruction but on a per pin bases. Because this feature occurs on a per-pin basis, normal device operation (mission mode) is possible with the exception of the desired faults.

For more information on any of these features, refer to Application Note AN-1313, SCAN90CP02 Design-for-Test Features.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor certifies that the products and packing materials meet the provisions of the Customer Products Stewardship Specification (CSP-9-111C2) and the Banned Substances and Materials of Interest Specification (CSP-9-111S2) and contain no "Banned Substances" as defined in CSP-9-111S2.
