CMOS RESET IC

BD48XXG/FVE BD49XXG/FVE

Rohm's BD48XXG/FVE and BD49XXG/FVE are series of high-accuracy, low-power VOLTAGE DETECTOR ICs with a CMOS process. For flexible choice according to the application, BD48XXG/FVE series with N channel open drain output and BD49XXG/FVE series with CMOS output are available in 38 voltage types from 2.3 V to 6.0 V in steps of 0.1 V in different packages, totaling 152 models.

Applications

Every kind of appliances with microcontroller and logic circuit

Features

- 1) Detection voltage: 0.1V step line-up 2.3 to 6.0V (Typ.)
- 2) High-accuracy detection voltage: ±1.5% guaranteed (Ability ±1%)
- 3) Ultra low current consumption: 0.8µA typ. (Output is High.)
- 4) Nch open drain output (BD48XXG/FVE series), CMOS output (BD49XXG/FVE series)
- 5) Small package VSOF5(EMP5) : BD48XXFVE/BD49XXFVE SSOP5(SMP5C2) : BD48XXG/BD49XXG

Selection guide

For BD4XXXX series, detection voltage, output circuit types (Refer to the block diagram at P3), and package (Refer to the dimension at P14) can be selected for your own application. Part number of devices for each specification is shown below.

Part No.	Specification	Contents
1	Output circuit types	8 : Open drain output 9 : CMOS output
2	Detection voltage	Ex.: Vs: described in each 0.1V step for 2.3V to 6.0V range (29 means 2.9V)
3	Package	G : SSOP5 (SMP5C2) FVE : VSOF5 (EMP5)

Pin layout

Pin layout of VSOF5(EMP5) and SSOP5(SMP5C2) is different as shown below. (Fig.1, Fig.2) When used as replacement, please consider the difference. (The detail of packages is shown at P14.)

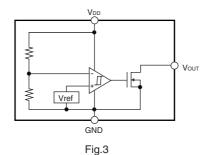

(Note) Connect SUB pin with GND pin.

Block diagram

Two output types can be used. One is BD48XXG/FVE (Fig.3) of open drain output type, and the other is BD49XXG/FVE (Fig.4) of CMOS output type.

BD48XXG/FVE: Open drain output

BD49XXG/FVE: CMOS output

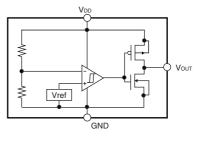

Fig.4

Absolute maximum rating (Ta=25°C)

To prevent the functional deterioration or thermal damage of semiconductor devices and ensure their service life and reliability, they must be designed and reviewed in such a way that the absolute maximum rating can not be exceeded in any cases or even at any moment.

Parameter		Symbol	Limits	Unit	
Power supply voltage		VDD – GND	- 0.3 to + 10	٧

Power dissipation VSOF5 (EMP5) *2		Pd	100	mW	
Operating temperature		Topr	- 40 to + 85	°C	
Storage	temperature	Tstg	- 55 to + 125	Ç	

^{*1} Derating : 1.5mW/°C for operation above Ta=25°C *2 Derating : 1.0mW/°C for operation above Ta=25°C

Power supply voltage

This voltage is the applied voltage between VDD and GND. The applied voltage should not exceed the indicated value.

Output voltage

VOUT pin voltage should not exceed the indicated value. For Nch open drain output type, VDD applied voltage and VOUT pin H output voltage can be used independently. Both of them should not exceed the each indicated value.

Operating temperature range

The circuit function is guaranteed within the temperature range. However, the operating characteristics are different from that of Ta=25°C. If they are any questions about the extent of guarantee of circuit functions in this operating temperature range, please ask for more technical information.

• Storage temperature range

This IC can be stored up to this temperature range without deterioration of characteristics. However, an abrupt thermal shock of extreme temperature fluctuations may cause the deterioration of characteristics.

^{*3} When only IC is used.

Power dissipation

Power consumption of the IC

Circuit current at ON/OFF is very small. Power consumption in output depends on each load connected with Vout pin. Please note that total power consumption must be within a power dissipation range in the secure area of the entire operating temperature. Power dissipation of these packages; SSOP5 (SMP5C2) package (BD48XXG/BD49XXG) Fig.5, and VSOF5 (EMP5) package (BD48XXFVE/BD49XXFVE) Fig.6 is shown below.

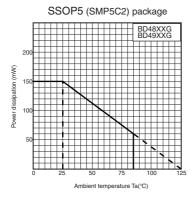

Fig.5 Thermal derating curve

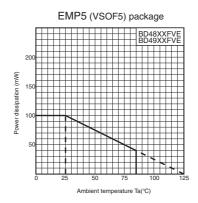

Fig.6 Thermal derating curve

When it is used in the ambient temperature of (Ta)=25°C and more, make reference to each thermal derating characteristics of used package. Both Fig.5 and Fig.6 show these characteristic when only IC is used.

^{*1} Operation is guaranteed forTa=25°C.

Note) Minimum operating voltage

Vout output becomes inconsistent if the VDD is equal to or lower than the operating limit voltage. It goes open, H, or L.

Note) Hysteresis voltage=(Reset release voltage)-(Reset detection voltage) [V]

Term explanation

 Detection voltage (Vs) : VDD voltage when the output (Vout) goes from "H" to "L".

 Release voltage (Vs+∆Vs) : VDD voltage when output (Vout) goes from "L" to "H".

· Hysteresis voltage : The difference between detection voltage and release voltage. Malfunction due to noise in VDD

(within hysteresis voltage) could be avoided by hysteresis voltage.

^{*2} TPLH: VDD=(Vs typ.-0.5V)→ (Vs typ.+0.5V).

Note) RL is not necessary for CMOS output type.

Operating explanation

Ex.) For both open drain type (Fig.7) and CMOS output type (Fig.8), detection voltage and release voltage are threshold voltage. When voltage applied to VDD pin reaches each threshold voltage, VOUT pin voltage goes "H" → "L" or "L" → "H". BD48XXG/FVE series are open drain types and pull-up resistor must be connected to VDD, or other power supply. (In this case, output (VOUT) H voltage is VDD, or other power supply voltage.)

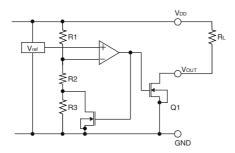

Fig.7 (BD48XX type Internal block diagram)

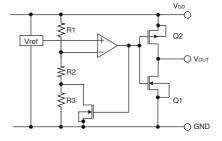

Fig.8 (BD49XX Internal block diagram)

SWEEP DOWN for VDD

When VDD is equal to or more than the release voltage (Vs+ Δ Vs), output VOUT is in "H" mode. (Nch output transistor Q1 is OFF, Pch output transistor Q2 is ON.) When VDD is gradually decreased, output (VOUT) turns "L" in the detection voltage (Vs). (Nch output transistor Q1 is ON, Pch output transistor Q2 is OFF.)

• SWEEP UP for VDD

When VDD is equal to or lower than the detection voltage (Vs+ Δ Vs), output VOUT is in "L" mode. (Nch output transistor Q1 is ON, Pch output transistor Q2 is OFF.) When VDD is gradually increased, output (VOUT) turns "H" in the release voltage (Vs). (Nch output transistor Q1 is OFF, Pch output transistor Q2 is ON.)

- Some hysteresis is given such a way that the release voltage is the detection voltage X (1.05 Typ.).
- The output becomes inconsistent if the VDD is equal to or lower than the operating limit voltage.

Timing waveform

Ex.) The relation between input voltage VDD and output voltage VOUT when VDD is increased and decreased is shown below. (Circuit is shown above. Fig7, 8)

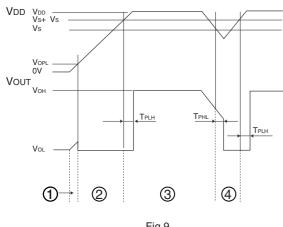

Fig.9

- ① If the VDD is equal to or lower than the operating limit voltage (VOPL) at power-up, the output is inconsistent.
- ②When the VDD is equal to or lower than the reset release voltage (Vs+ Δ Vs), VOUT=L.
- When VDD exceeds the Reset Release Voltage, VOUT turns H with a delay of TPLH. See Fig. 15 and 17 for the reference waveform.
- 4 If the VDD goes below the detection (Vs) at power-down or instantaneous power failure, VOUT turns L with a delay of TPHI.

See Fig.16 and 18 for the reference waveform. The potential difference between the detection voltage and the release voltage is called hysteresis (Δ Vs). The products are designed so as to prevent power supply fluctuation within this hysteresis from causing fluctuation in output in order to avoid malfunction due to noise.

Application circuit

1)Application circuit as ordinal supply detection reset is shown below.

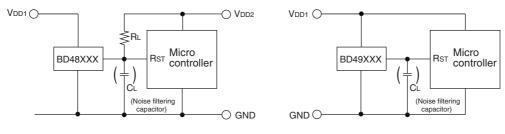

Fig.10 Open collector output type

Fig.11 CMOS output type

Output type of BD48XXG/FVE series (Open drain type) and BD49XXG/FVE series (CMOS type) is different. An example of usage is shown below.

- When the power supply of microcontroller (VDD2) and power supply for the reset detection (VDD1) is different. Provide RL for the output of a product with open drain output (BD48XXG/FVE series) on the VDD2 side, as shown in Fig.10.
- When the power supply of microcontroller and that of reset is same (VDD1).
 A product with CMOS output (BD49XXG/FVE series) can be used as shown in Fig.11. Or if RL is provided with open drain output (BD48XXG/FVE series) on the VDD1 side, it can be used.

When the capacitor C_L for noise filtering and for delay time setting is connected to Vout pin (reset signal input pin of microcontroller), make a setting in consideration of the wave rounding of the rise and fall of Vout. (See the delay shown in Fig.14 as the reference.)

7/15

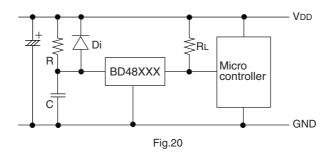

Application circuit when microcontroller is reset with OR connection of the two types of the detection voltage is shown below.

When there is more than one system power supply and it is necessary to individually monitor the power supply (VDD1, VDD2) to reset the microcontroller, open drain output type BD48XXG/FVE series can be connected to form an OR circuit as shown in Fig.19 for pulling up to an arbitrary voltage (VDD3) to adjust the H voltage of the output to the microcontroller power supply (VDD3).

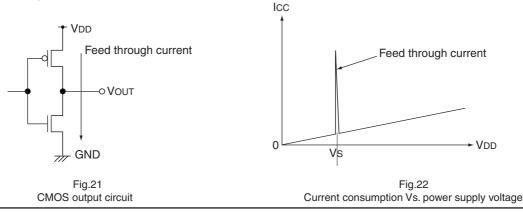

3)Application circuit when it is used as Power-on reset is shown below. (However, it can be used for only BD48XXG/FVE series.)

If the power supply voltage is lower than the guaranteed range, power-on reset of the microcontroller is necessary to prevent program runaways and unwanted memory register updates. A power-on reset circuit used with BD48XXG/FVE series (Nch open drain) is shown in Fig.20. C and R connected to VDD pin of RESET IC make the wave rounding of the VDD pin and generate input signal with time constant. When the input power supply is fallen, the electric charge of the capacitor is discharged through Di connected between VDD pin and VDD. The value of the resister R should be enough to prevent malfunction caused by circuit current through BD48XXG/FVE series. Set in such a way that the following expression stands:

Hysteresis > R X { (Circuit current at ON) - (Circuit current at OFF) }

Do not use BD49XXG/FVE series (CMOS output) for the power-on reset because malfunction may occur. (Oscillation at output etc.) The feed through current (CMOS output) at detection may cause malfunction mentioned above. (Feed through current is the current flowed from VDD into GND instantly when output goes "H" \leftrightarrow "L".)

Establishment of RESET transfer delay time

Delay time at the rise and fall of VDD can be established by RL, CL connected to VOUT pin.

Delay time at the rise of VDD TPLH: Time until when VOUT is 1/2 of VDD after the rise of VDD, and beyond
the release voltage (Vs+∆Vs).(See P7). It is the total time established
by IC internal transfer delay time TD and external RL, and CL.

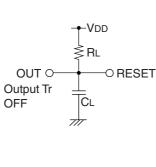

Fig.23

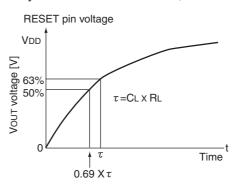

Fig.24 RESET pin voltage

If the threshold voltage of the RESET terminals is 1/2 of VCC, delay time TPLH at the rise of VDD is shown in the expression below.

TPLH=0.69 X CL X RL+TD

TD=Internal circuit delay of BD48XX : About 35 μ s (typ.) VDD=(Vs-0.5V) \rightarrow (Vs+0.5V)

CL: Capacity of external capacitor beween Vout pin and GND

RL: External resistance between Vout pin and power supply

• Delay time at the fall of VDD TPHL: Time until when VOUT is 1/2 of VDD after across the detection voltage (Vs).(See P7). It is the total time established by IC internal transfer delay time TD and external RL, and CL.

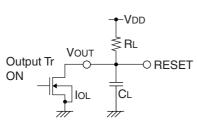

Fig.25

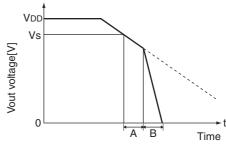

Fig.26 RESET pin voltage

TPHL=A+B

A = About 70μs(Typ.): Internal IC transfer delay time of BD4842

 $B = \frac{CL X Vs}{IOL}$: Delay time by external CL, RL

CL : Capacity of external capacitor beween VOUT pin and GND

Vs : Detection voltage

IOL: "L" output current of BD48XX

Make sure to test in actual because it depends on detection voltage.
Reference:Vs=2.4V, VDD=About 8mA at A:typ.

3)Standard packaged quantity and IC direction

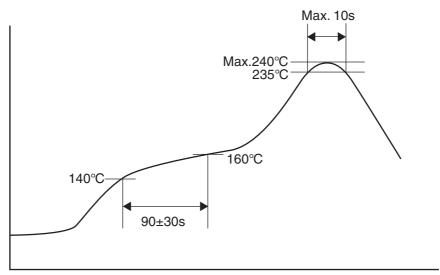

The standard packaged quantity is 3,000 pcs/reel. Orders should be in multiples of the standard packaged quantity. The ICs are TR oriented (as shown below).

- Recommended mounting conditions
 - SSOP5 (SMP5C2) allows either reflow or flow soldering mounting.
 - VSOF5 (EMP5) allows reflow mounting.
 The mounting conditions are shown below.

1)Reflow

Up to two reflows are allowed.

Fig.41

Notes

- No technical content pages of this document may be reproduced in any form or transmitted by any
 means without prior permission of ROHM CO.,LTD.
- The contents described herein are subject to change without notice. The specifications for the product described in this document are for reference only. Upon actual use, therefore, please request that specifications to be separately delivered.
- Application circuit diagrams and circuit constants contained herein are shown as examples of standard use and operation. Please pay careful attention to the peripheral conditions when designing circuits and deciding upon circuit constants in the set.
- Any data, including, but not limited to application circuit diagrams information, described herein are intended only as illustrations of such devices and not as the specifications for such devices. ROHM CO.,LTD. disclaims any warranty that any use of such devices shall be free from infringement of any third party's intellectual property rights or other proprietary rights, and further, assumes no liability of whatsoever nature in the event of any such infringement, or arising from or connected with or related to the use of such devices.
- Upon the sale of any such devices, other than for buyer's right to use such devices itself, resell or
 otherwise dispose of the same, no express or implied right or license to practice or commercially
 exploit any intellectual property rights or other proprietary rights owned or controlled by
- ROHM CO., LTD. is granted to any such buyer.
- Products listed in this document are no antiradiation design.

The products listed in this document are designed to be used with ordinary electronic equipment or devices (such as audio visual equipment, office-automation equipment, communications devices, electrical appliances and electronic toys).

Should you intend to use these products with equipment or devices which require an extremely high level of reliability and the malfunction of with would directly endanger human life (such as medical instruments, transportation equipment, aerospace machinery, nuclear-reactor controllers, fuel controllers and other safety devices), please be sure to consult with our sales representative in advance.

About Export Control Order in Japan

Products described herein are the objects of controlled goods in Annex 1 (Item 16) of Export Trade Control Order in Japan.

In case of export from Japan, please confirm if it applies to "objective" criteria or an "informed" (by MITI clause) on the basis of "catch all controls for Non-Proliferation of Weapons of Mass Destruction.
